

sn o	Title	Precondition	Steps taken	Expected result
1	Verify that for given destination and with given check-in check-out dates hotels are available	Hotel should exist for given destination and check-in check-out dates	1)Enter destination 2)Enter check-in and check-out dates 3)Apply search	10 or more than 10 hotels should be recommended to the user
2	Verify different destinations and find a destination for which there is less than 10 recommendations for hotels	Atleast there should be 1 hotel in the DB for the given destination(for better user experience)	1)Enter different destinations and apply search i.e., mia, lax, blr, atl, etc	Atleast one hotel should be returned
3	Verify on listing page that the returned hotels should be cheaper to that of the selected one candidate_total_price < selected_total_price 1rs greater also should not be considered as cheaper and 1rs lesser should be considered cheaper	User is on the hotel listing page. The selected hotel has a known total price	Select a hotel with a total price of ₹10,000 . Compare the candidate_total_price of each recommended hotel with the selected_total_price. Verify the recommendations against the business rule:	List of hotels should be cheaper to that of the selected one Hotel priced at ₹9,999 is displayed in the recommendation list. Hotel priced at ₹10,000 is not displayed. Hotel priced at ₹10,001 is not displayed
4	Verify that the recommended hotel list should be of the same dates and destination as entered by the user	destination and given check-in and check-out dates should be valid	Enter destination Enter check-in and check-out dates	Same destination hotel list should be returned Same check-in and check-out date should be returned
5	Verify the price of the hotels deals by changing the currency, price should not vary	There should be currency converter functionality on the page	Open the currency converter pop-up and change it to the currency have more characters	Currency should be changed on returned hotel deals and ui should not be distorted
7	Verify that hotel deals UI should be as per figma given by design and data team contains all the informations.	Figma should be given by the design team and data should be given by the data team with all required information	Apply a search by giving all the inputs Verify UI should not be distorted Design should be as per figma Data should be as per the given data by data team	Hotel name, Nightly price , Total price, Star rating , Review score + review count, Distance from selected hotel (km), Key amenities, “Why recommended”

				tags all the details should be as per requirement of the user
8	Verify that the recommended hotels should be better in quality Validate quality by computing overall score	Overall Score calculating formula by which we are considering it better in quality	Calculate review_score, star rating, amenity_match_percent and calculate overall score and compare it to the selected hotel	Recommended hotels should have overall score greater to that of the selected one
9	Verify that the recommended hotels should have highest scoreDelta and equal scoreDelta should be excluded	scoreDelta calculating formula should be given by which we can confirm scoreDelta	Calculate candidate_score and selected_score And calculate scoreDelta as candidate_score – selected_score Compare returned hotel deals to that of the selected one scoreDelta should be greater	Hotel deals returned should have highest score delta as candidate_score – selected_score same scoreDelta deals should not be included
10	Verify that the hotels deals given by recommendation system is of lowest total price, high review count and lowest distance km	Hotel deals should contain price, review count and distance in km	Apply a search Hotel deal cards should contain price review count and distance Price should be lowest, distance should be lowest and review count should be high	Deals should be of lowest total price, high review count and lowest distance km
11	Verify ranking by different combination of scoreDelta, high review count, lowest total price and lowest distance km	Hotels with different ScoreDelta, total price, distance and review count are available.	1. Select a hotel. 2. Perform search. 3. Verify recommendation order.	Hotels are ranked by ScoreDelta → Lowest Total Price → Lowest Distance → Highest Review Count and only Top 10 are displayed.
	Verify edge case – verify min and max distance i.e., 0km and 5KM should be handled properly	Hotels exist at 0 km, 5 km and >5 km.	1. Select a hotel. 2. Search recommendations. 3. Check hotels at 0 km, 5 km and >5 km.	Hotels at 0 km and 5 km are included; hotels >5 km are excluded.
12	Verify all the factors and ensure that the returned list should be in top 10	More than 10 eligible hotels are available.	1. Select a hotel. 2. Perform search. 3. Count recommendations.	Exactly 10 highest-ranked hotels are displayed.
13	Do a negative testing	Highest-priced	1. Select the highest-	Only hotels that are

	by selecting hotel of highest price and the apply a search again	hotel is available.	priced hotel. 2. Search recommendations.	cheaper, better, within 5 km, available, and Top 10 are returned. If fewer than 10 qualify, only eligible hotels are displayed.
14	Apply a search by selected a hotel with same input and selected hotel should be excluded	Selected hotel meets all recommendation criteria except exclusion rule.	1. Select a hotel. 2. Search recommendations.	The selected hotel is not displayed in the recommendation list.
15	Verify that the hotels should not contain any inactive or illegal property	Test data contains active, inactive, and illegal properties.	1. Select a hotel. 2. Perform recommendation search. 3. Verify returned hotels.	Inactive and illegal properties are not displayed in the recommendation list.
16	Verify the data returned by the recommendation system to that stored in the DB that it is returning same data or not	Recommendation data exists in the database.	1. Perform recommendation search. 2. Fetch corresponding DB records. 3. Compare UI/API data with DB.	Hotel details (name, price, rating, reviews, amenities, distance, etc.) match the database records.
17	Verify that the returned property should not be sold out by computing Sold-out inventory / inventory_available = 0	Test data contains hotels with inventory_available = 0 and >0.	1. Select a hotel. 2. Search recommendations. 3. Verify inventory status.	Hotels with inventory_available = 0 are not displayed ; only available hotels are recommended.
18	Verify that returned properties should not be duplicate	Duplicate hotel records exist in the dataset.	1. Perform recommendation search. 2. Check the recommendation list.	Each hotel appears only once in the recommendation list.
19	Verify that by keeping amenities as empty and apply search	Selected hotel has empty/null amenities.	1. Select the hotel with no amenities. 2. Perform recommendation search	Recommendation system should not crash either it should return results with best deals or give a validation message
20	Calculate nightly price and total price of the stay	Hotel stay dates and nightly price are available.	1. Note nightly price and number of nights. 2. Calculate expected total price. 3. Compare with displayed total price.	Total Price = Nightly Price × Number of Nights (plus applicable taxes/fees if included as per

				business rules), and the displayed amount is correct.
